APOCYNUM ANDROSÆMIFOLIUM.

Dog's Bane.

=

PLATE XXXVI.

THIS is a branching perennial plant, found from Canada to Carolina about the sides of fences and the borders of woods. It has a peculiarly neat aspect derived from its smoothness, its leafless and coloured stalk, bushy top and delicate flowers. Like the other American species, it is a lactescent plant, with a fibrous bark. It attains its flowering period in June and July.

The genus Apocynum has *a bell-shaped corolla; a nectary of five corpuscles surrounding the germ; anthers adhering to the stigma by the middle; follicles two; seeds with down.*

The present species is *glabrous, its stem erect and branching; cymes lateral and terminal; corolla spreading.*
